**SPX Monitoring purposes; Neutral.**

**Monitoring purposes GOLD: Long GDX on 1/29/19 at 21.96.**

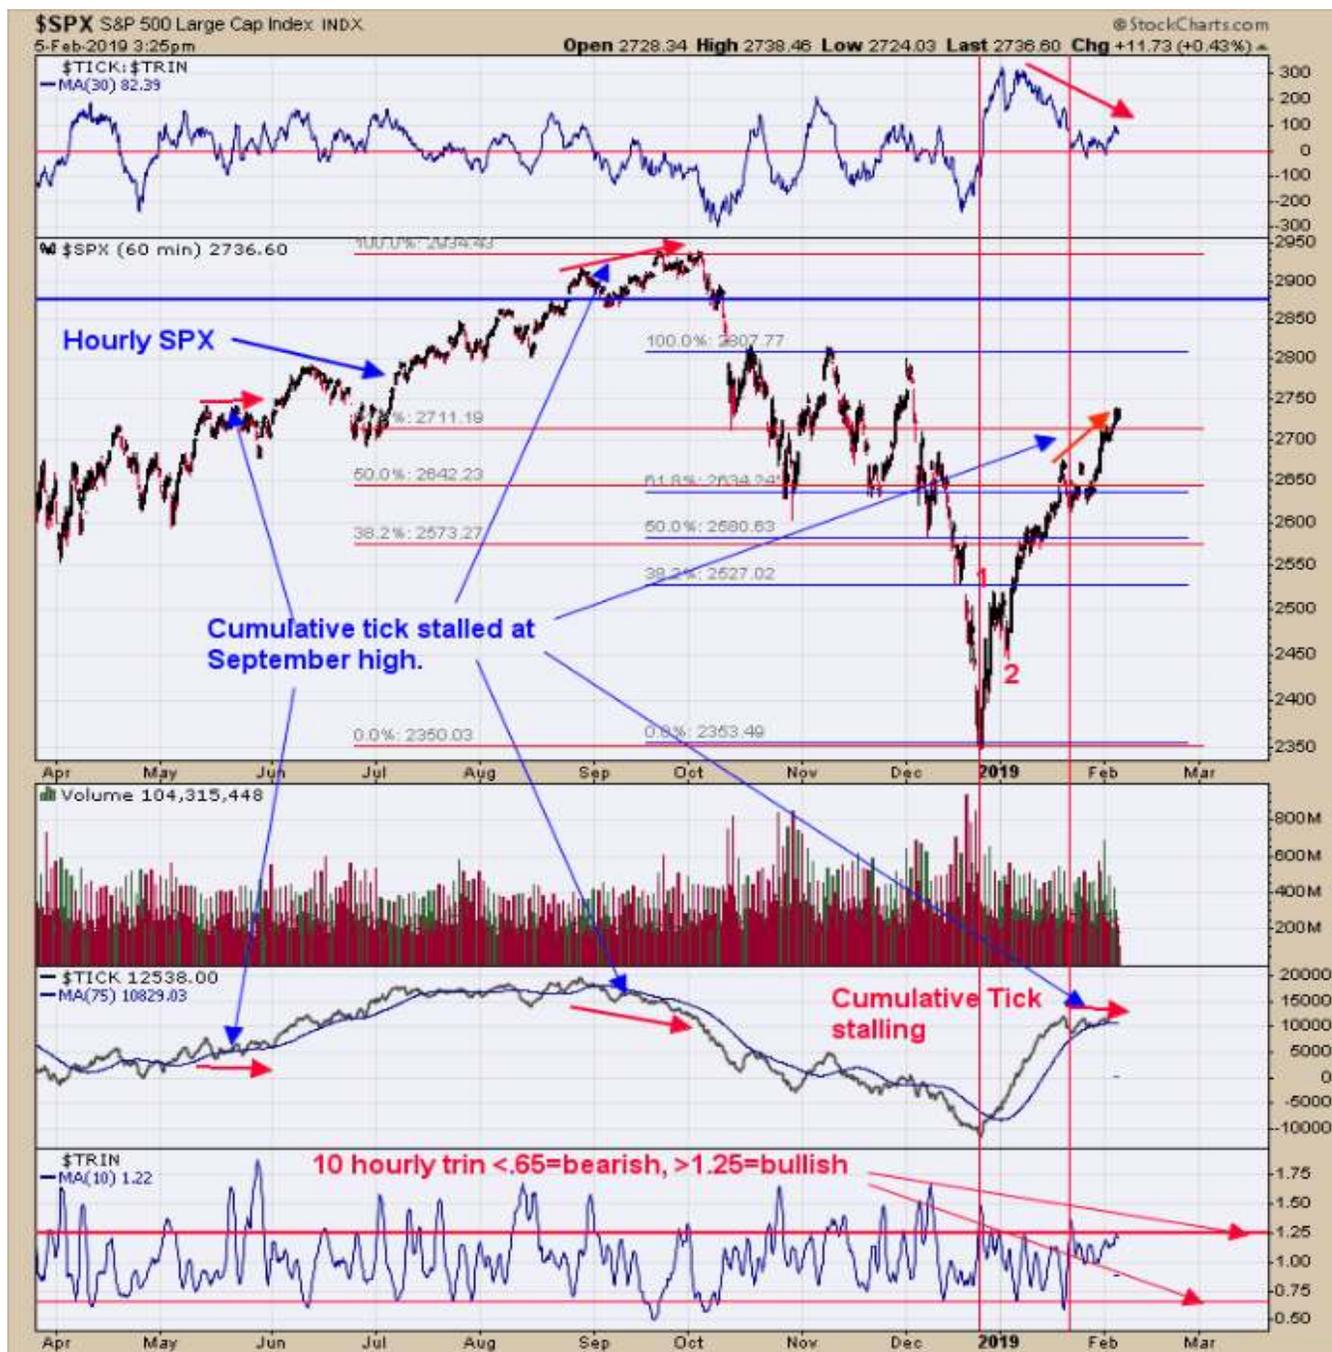

**Long Term Trend SPX monitor purposes; Long SPX on 10-19-18 at 2767.78**

We have "800" phone update that cost \$6.00 per call, and billed to a credit card. Call (1-970-586-4760) for sign up. We update Eastern Time at 9:45 and 4:10. Question? Call (402) 413-0980.

According to “(@aukarlewitz) SPX up 5 day in a row, Since 2011, N = 33 times. SPX closed higher within next five days in all except one (97% success)”. The graph above shows the NYSE intermediate term volume momentum Oscillator. When this Oscillator gets above 185 (current reading is 195.13) the market is near a stall phase if not a short term top. What this chart tells up is that the next resistance area is near 2800 SPX range which is the November, December highs may stall the market. State of the Union address is tonight and could produce a reaction in the market on Wednesday. If there is a reaction the “five day up rule” suggests one should buy the market and the test of the 2800 SPX level should be resistance as the NYSE intermediate term Volume Momentum Oscillator is extended; this is just a theory, lets see what develops. Yesterday we said, “When the Cumulative tick is rising, than that is usually a bullish sign for the SPY and when declining a bearish sign. The middle window is the hourly SPX and below that the hourly Cumulative tick. Since mid January the SPX has pushed modestly higher and the Cumulative tick worked sideways. We have two other times in the last six months where the SPX moved higher and the ticks went sideways or declined and one of those times came at the September highs.” The bottom window is the 10 hourly moving average of the Trin. Readings above 1.25 have been a bullish sign for the market and below .65 have been bearish (the current reading is 1.23). State of the Union address is tonight and could have an affect on the markets. With the 10 hourly Trin near the 1.25 bullish level, it would suggests if there is a pull back it should be bought. Bigger picture is bullish but short term trend is unclear. Follow us on twitter. [@OrdOracle](https://twitter.com/OrdOracle)

2 Signals are provided as general information only and are not investment recommendations. You are responsible for your own investment decisions. Above is a short term view of GDX. The top window is the RSI for GDX. Readings above RSI 50 are bullish (light blue) and below 50 bearish (TAN) and right now the RSI is hovering near the 70 range in a sold bullish level. We have three moving average on GDX which are the 3, 9, and 11 period and when all three cross either cross to the upside or cross to the down side a bullish or bearish signal is triggered. In late January all three crossed to the upside triggering a bullish signal and remains on the bullish signal. Second window up from the bottom is the GDX/GLD ratio with a 10 period moving average. GDX/GLD ratio crossed above its 10 period moving average triggered a bullish crossover. As it sets now the short term picture remains bullish and higher prices expected. Long GDX on 1/29/19 at 21.97.
