We have "800" phone update that cost \$6.00 per call, and billed to a credit card. Call (1-970-586-4760) for sign up. We update Eastern Time at 9:45 and 4:10. Question? Call (402) 413-0980.

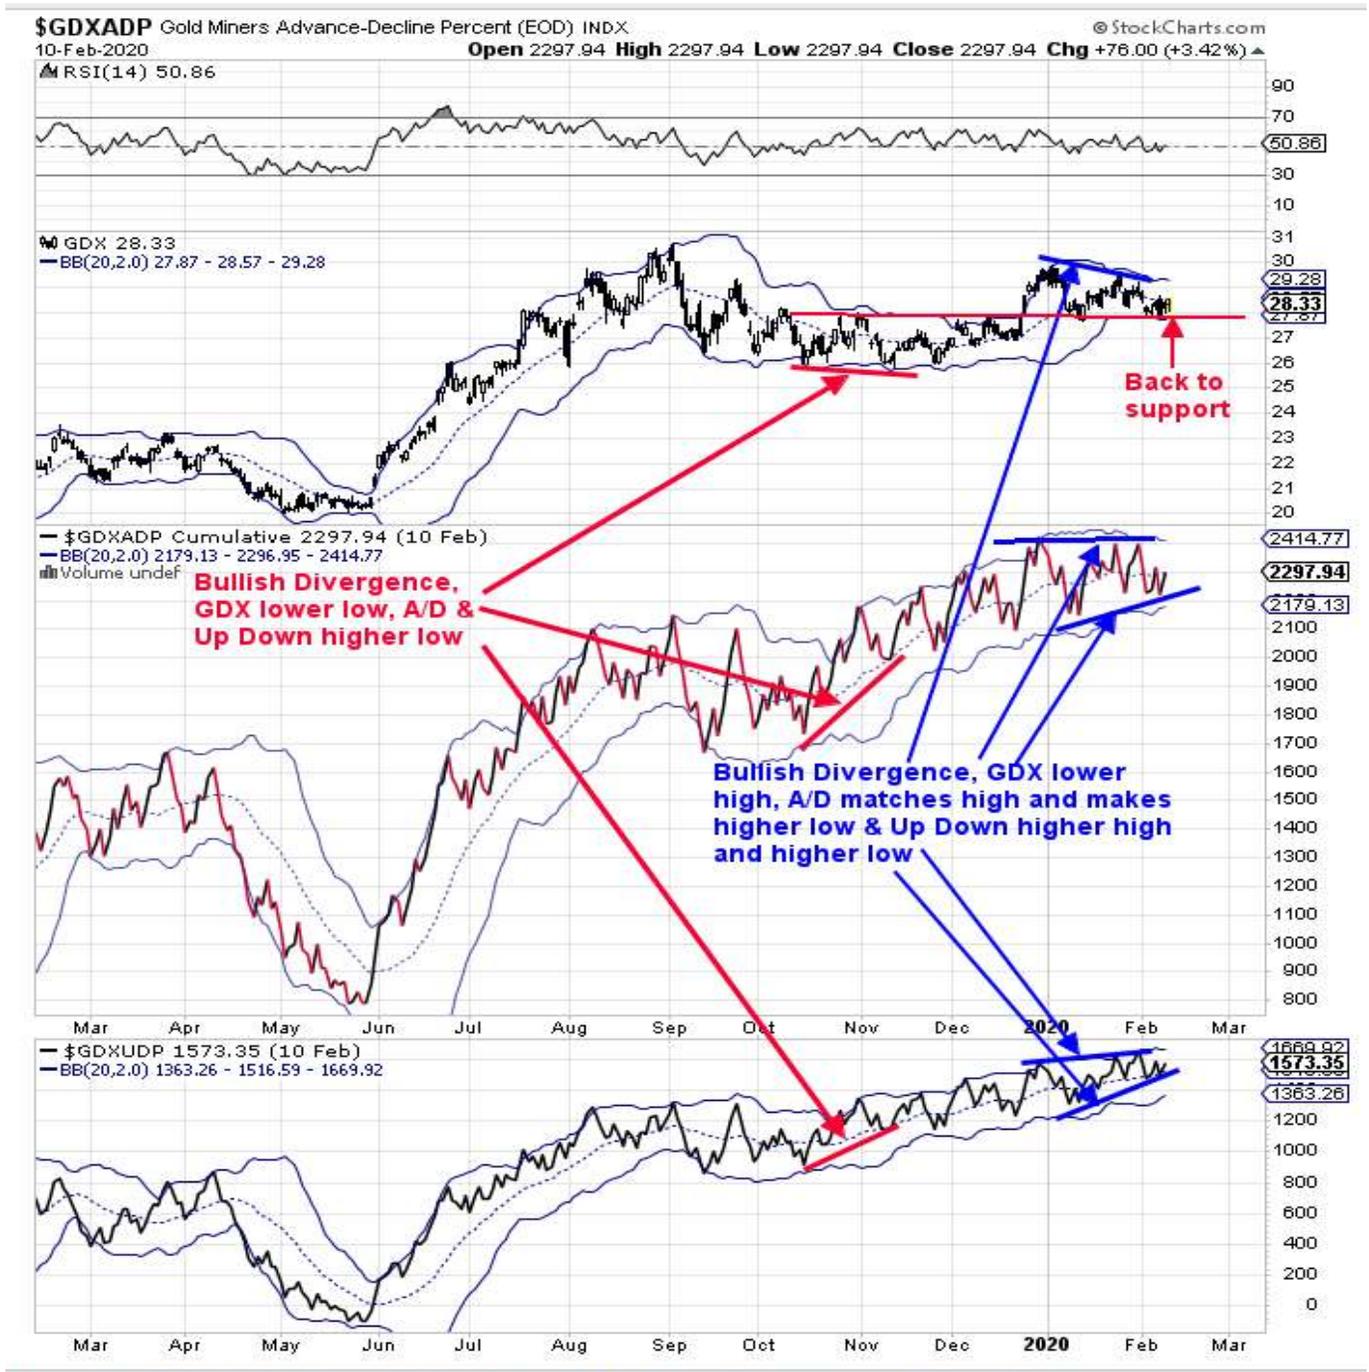

The bottom window is the 1 day average of the SPY/VIX ratio. This indicator has been good in finding the short term direction is the SPY. When it divergences than the SPY may be close to a reversal. Over the last several days the SPY managed to move higher while the SPY/VIX ratio has made lower highs. Also, today the SPY closed at a new high and the ratio made a lower high, both conditions are a bearish sign. This is the week before option expiration and a week where whipsaws are common. The intermediate term appears bullish but short term a retracement is possible. Expiration week looks to be an up week and therefore if market does retrace short term we will be looking for a bullish setup. Follow us on twitter. [@OrdOracle](https://twitter.com/OrdOracle)

The above chart was taken a couple hours after the open. As you can see the Up volume/Total volume was near 80% and showing a “Sign of Strength” (SOS). The Advance/Decline (middle window) showed a reading of 3.10; above 2.75 which is also an SOS. However on the close the UP Volume/ Total Volume dropped to 70% and Advance/Decline ratio to 2.42 and both below an SOS. An SOS today would have been a very bullish sign for short term. Trend is up but market still could stall short term. The red verticals on the chart were “SOS” days and there was one last week which is bullish sign. Join us on twitter. [@OrdOracle](#).

The internals so far look good for GDX. The bottom window is the Cumulative Up Down Volume percent for GDX. This indicator has been making higher lows and higher highs going back to late December while GDX has made lower highs and has matched its previous low which is a bullish divergence. Next window up is the cumulative advance/decline percent which has made higher lows and has matched its previous high which is also a bullish divergence. So far these two indicators suggest there is strength in GDX and suggest this sideways pattern should resort into a rally phase. GDX may see a 'Sign of Strength' (strong high volume move) through the previous high of 31.00 in the coming weeks. Long GDX on 1/29/19 at 21.97.
